Hospital Patients Satisfaction Report

Total Patients Visits

Total Patients by Year

Key Findings:

- Significant Weekend Gap:** Patient visits are overwhelmingly concentrated on weekdays (6.6K) compared to weekends (2.6K), indicating a strong preference or limitation for weekday scheduling.
- Year-Over-Year Growth:** Patient volume increased by approximately 12% from 2019 (4,338) to 2020 (4,878), showing clear growth in demand for services.
- Monthly Volatility Confirmed:** The chart shows high variability in daily visits (e.g., 999 vs. 489), aligning with previous findings of operational unpredictability.

Business Interpretation &

Recommendations:

- The **weekday surge** is likely creating bottlenecks, contributing to the long wait times identified earlier. The consistent growth trend means this pressure will increase.
- Recommendation:** Pilot extended weekend hours or shift some non-urgent services to Saturdays to balance the load, improve wait times, and capture unmet demand

Total Patients by Age Group

Total Patients by department_referral

Key Findings:

- Patient Base Skews Adult:** The vast majority of patients are Adults (7.1K), significantly outnumbering all other age groups combined. Adolescents are the next largest group.
- High Volume of Unreferred Patients:** A large portion of patients (5.4K) have "None" listed for department referral, suggesting they are walk-ins.
- Referral Pattern:** General Practice is the leading source of referrals (1.8K), followed by Orthopedics (1.0K).

Recommendations:

- The high volume of **Adults** and **walk-ins ("None" referral)** directly explains the pressure on wait times. This group likely uses the service for general needs, increasing queue volume.

Native American/Alaska Native	6.28	33.87	5.50	34.19

Total Patients Visits

Key Findings:

- Patient Satisfaction vs. Wait Time:** The data confirms that longer wait times correlate with lower patient satisfaction scores. This trend is consistent across most age groups and racial categories.
- High-Risk Demographic:** African American patients, particularly those aged 70+, report the lowest satisfaction (4.96) while experiencing some of the highest average wait times (34.74 minutes). This group is the most critical priority for intervention.
- Operational Volatility:** Patient visit volume fluctuates significantly, with a notable drop in Month 5.

Recommendations:

- Target the highest-risk group first:** Reduce wait times for patients aged 70+, especially African American patients, to address the lowest satisfaction scores.
- Investigate the root cause:** Study why satisfaction is lowest for African American seniors beyond just wait time to ensure a complete solution.

Total Patients by Year

Patient volume is increasing, which is good for growth but adds pressure on capacity.

Key insights

- Total patients rose from about 4.3K in 2019 to 4.9K in 2020, an increase of roughly 600 patients.
- This indicates stronger demand and more patients choosing the Hospital.

Business impact and action

- Higher volume can boost revenue but risks longer waits if capacity does not keep up.
- Review staffing and appointment availability, and consider adding hours or efficiency improvements to sustain this growth.

Hospital Patients Satisfaction Report

patient_waittime by patient_race

patient_waittime by Age Group

The charts show that most waiting time is concentrated among White patients and adults. This has direct implications for patient experience, equity, and resource planning.

Key insights

- By race, White patients account for the largest share of total waiting time, followed by African American and multiracial patients, while other groups represent smaller portions.
- By age, adults drive about three-quarters of all waiting time, far exceeding adolescents, teenagers, children, and infants combined.

Business impact

- Patient experience risk: Bottlenecks in adult visits likely drive complaints, lower satisfaction, and reduced capacity for new patients.
- Equity concerns: The race distribution may signal unequal service patterns and could affect community trust and retention if not monitored.

Focused recommendations

- Analyze average wait per patient by race and age to confirm where true gaps exist, adjusting for visit type and volume.
- Optimize adult flow by adding staff in peak adult hours and simplifying check-in and triage for common adult visit types

Age Bracket

Patient volume is evenly distributed across age groups, with no single group dominating.

Key insights

- There are 9,216 patients, and each age bracket (0–10, 11–20, 21–30, 31–40) has about 1,160–1,207 patients.
- The 21–30 group is only slightly higher, so demand is broadly balanced.

Business impact

- The clinic should support strong, age-appropriate services for all brackets rather than prioritizing one group.
- Each bracket is large enough to justify tailored programs, such as pediatric wellness or young-adult prevention.
